PROFILE

Data Analyst with a software engineering background in full-stack development (React, Node.js, TypeScript). Skilled in SQL, Python, and Power BI for end-to-end analysis from database querying through statistical exploration to interactive dashboard reporting. Brings production-engineering discipline (clean code, reproducible pipelines, scalable systems) to data analysis work. Eager to apply analytical thinking and technical depth to solve real business problems with data.

EDUCATION

Makhanlal Chaturvedi National University of Journalism and Communication

Bachelor of Computer Applications (BCA)

Bhopal / Satna, India

Expected Graduation: 2027

TECHNICAL SKILLS

Data & Analytics: SQL (SQLite), Python (pandas, matplotlib, seaborn), Power BI, Statistical Analysis, Data Cleaning & EDA, Data Visualization

Engineering Stack: JavaScript, TypeScript, React.js, Next.js, Node.js, Express.js, PostgreSQL, MongoDB, Git, Docker, REST APIs

PROJECTS

Olist E-Commerce Analysis | *SQLite, Python, Power BI*

[\[GitHub\]](#)

- Analyzed a Brazilian e-commerce dataset of 99,000+ orders across 9 relational tables using SQLite and Python to extract insights on a R\$15.4M Gross Merchandise Volume (GMV).
- Identified and isolated a backend data anomaly where failed carrier API routing defaulted to 180-day delivery estimates, preventing the artificial inflation of early delivery metrics.
- Executed an RFM (Recency, Frequency, Monetary) segmentation model on 96,000+ unique customers, revealing that over 40% of the user base fell into "At Risk" or "Lost" segments.
- Uncovered category performance divergence: "Watches & Gifts" generated 75% higher revenue per transaction despite having roughly half the volume of "Bed, Bath & Table".
- Designed an interactive Power BI dashboard featuring 5 dynamic slicers (Date Range, State, Category, RFM Segment, Shipping Type) to visualize revenue trends and logistics performance.

OTT Streaming Platform Analytics | *SQLite, Python, Power BI, SQL*

[\[GitHub\]](#)

- Built an end-to-end analytics pipeline consolidating 2,500 streaming titles across Netflix, Prime Video, and Hotstar into a single reproducible analysis workflow.
- Wrote 13 SQL queries including window functions (RANK, ROW_NUMBER, LAG) and CTEs to surface platform benchmarking, year-over-year trends, and genre-level Pareto analysis.
- Identified a ceiling effect via scatter analysis—high ratings raise a title's achievable popularity even though they don't guarantee it, a nuance invisible from the correlation coefficient alone ($r = 0.18$).
- Engineered a custom efficiency-ratio metric (popularity ÷ engagement) proving Netflix converts engagement into popularity most effectively, while Prime Video's volume-led strategy underperforms.
- Designed an interactive Power BI dashboard with cross-filtering slicers, diagnosing and resolving a data-model relationship issue that broke filter propagation across pre-aggregated tables.

Vortex – Distributed URL Shortener | *Next.js, TypeScript, Edge Functions, Redis, PostgreSQL*

[\[GitHub\]](#)

- Architected a high-performance URL shortener achieving sub-50ms global redirects by deploying redirect logic to Vercel Edge Functions across 100+ worldwide regions.
- Implemented cache-first architecture using Upstash Redis, reducing database queries by 95% and achieving 10-20ms response times on cache hits.
- Designed an asynchronous analytics pipeline using QStash message queues, capturing device type, location, and referrers without impacting redirect speed.
- Enforced privacy-conscious analytics by hashing IPs with SHA-256 before storage and filtering automated bot traffic, achieving 95%+ analytics accuracy.
